Technical whitepaper

Abstract

This document describes the Valkyrie Forge v9 crypter architecture, its stub generator, and its obfuscation engine rewrite. The paper is an internal research note and must not circulate outside the lab.

1. Architecture overview

The crypter operates on a three-stage pipeline: loader, stub, and unpacker. Stubs are emitted per target binary and signed via the private key stored at /srv/forge/keys/stubs_2026.pem.

2. Obfuscation engine

Rewritten in Rust. Uses opaque predicates and control-flow flattening. Runtime cost ~8% vs v8.

3. Tested against (fictional)

- Windows Defender 4.18.x
- SentinelOne 23.x
- CrowdStrike Falcon 7.x

Lead engineer: Linnea Bergström — l.bergstrom@nordicodelabs.se
